1 Preface

Boox, presented by Onyx International, a group of professionals who dedicate themselves in designing state-of-the-art reading terminal.

The beauty of the Boox is embodied in both its simplicity and its power. As we are going to show you, Boox is an open and flexible platform for both consumers and content providers.

Boox is powered by an 8-level grayscale e-ink screen that looks and feels like paper. Passive lighting and diffuse surface relaxes your eyes and reduces eye strain. The hand-writing system lets you take notes while reading and sketch up ideas that happen to emerge. Boox takes full advantage of new-generation e-ink screens: extremely low power consumption. Each full charge can sustain a few weeks' reading. By reducing paper consumption while providing a realistic paper-like reading experience, digital content helps to protect the environment without sacrificing convenience or life style.

Boox comes with viewers for most popular ebook and image formats, including PDF, HTML, CHM, EPub, TXT, and MobiPocket(NON-DRM). For content partners, we also provide support for custom formats and digital rights management solutions. All of our viewers have standard features such as layout management, font adjustment, full text search, zooming, and page flow.

For a next-generation information device, connectivity is essential. The user can connect to the Internet with build-in WiFi or other add-on modules to download new content or just surf the web. The web browser on Boox uses WebKit, the same software engine that powers desktop browsers such as Safari and Chrome, customized for the e-ink screen.

Boox, the new reading experience.

"Indeed," replied Elizabeth, "I am heartily sorry for him; but he has other feelings, which will probably soon drive away his regard for me. You do not blame me, however, for refusing him?"

Smart Direct Memory Access (SDMA)

The SDMA core is able to control and exchange data with these systems by sending instructions and reading or writing data from/to the functional units' registers via the FUBUS. This is done with the `ldf` and `stf` instructions.

The following sections provide introductions to the available functional units. [Section 40.16, "Functional Units Programming Model"](#) provides descriptions the functional units' behaviors.

40.6.1 CRC Calculation Unit

The Cyclic Redundancy Check (CRC) unit can perform CRC calculation. A single byte of data can be processed every cycle, but up to four bytes can be simultaneously loaded.

The CRC unit supports the following set of polynomials:

```

CRC32:  X32+X26+X23+X22+X16+X12+X11+X10+X8+X7+X5+X4+X2+X+1
CRC16:  X16+X15+X7+1
CCITT16: X16+X12+X5+1
IS136:  X12+X10+X8+X5+X4+X3+1
CRC10:  X10+X9+X5+X4+X+1
CRC8:   X8+X2+X+1
parity:  X8+1
    
```

40.6.1.1 CRC Structure

[Figure 40-9](#) describes the overall structure of the CRC unit and introduces its registers that are accessible by the SDMA core via the FUBUS.

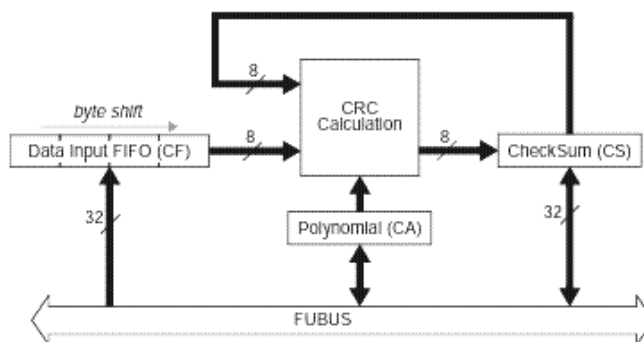

Figure 40-9. CRC Structure

40.6.1.2 CRC Data Processing

CRC processing requires the following three stages:

1. The preliminary initialization stage consists of selecting the desired polynomial, and storing the initialization pattern into the checksum register.

So far each recital confirmed the other; but when she came to the will, the difference was great. What Wickham had said of the living was fresh in her memory, and as she recalled his very words, it was impossible not to feel that there was gross duplicity on one side or the other; and, for a few moments, she flattered herself that her wishes did not err. But when she read and re-read with the closest attention, the
